## ANALYSIS

### CATALYST / TODAY'S DRIVER

SDRL is trading within pennies of its 52-week high at $52.87 on elevated volume, driven by continued offshore rig demand and sector rotation into Energy (+7.9% leading sector this week). The move appears to be a technical continuation breakout as deepwater day-rates remain structurally elevated.

### BUSINESS & POSITION

Seadrill is a leading international offshore drilling contractor operating a fleet of drillships, semi-submersibles, and jack-ups serving major national and international oil companies in deepwater and ultra-deepwater basins globally. Post-restructuring, the company carries a leaner balance sheet and benefits disproportionately from the tight high-specification rig supply environment where new-build lead times extend well into the decade.

### FACTOR & THEME

Seadrill sits at the intersection of the energy capex supercycle and the secular underinvestment in offshore infrastructure - deepwater rig utilization is at multi-year highs and day-rates for harsh-environment drillships have approximately doubled since 2022. The Energy sector is the second-leading sector this week (+7.9% vs SPY), providing a macro tailwind that amplifies individual stock momentum.

### BREAKOUT SIGNAL

Close above $52.87 (52W high) on volume >1.8x 20d average - confirming supply absorption and marking a clean 52-week breakout

### INSTITUTIONAL

No insider buying activity detected in the last 60 days (insider_count: 0; insider_summary blank). Institutional ownership data is not available from this feed - recommend cross-referencing 13F filings, though post-restructuring offshore drillers typically attract energy-specialist and event-driven funds. Volume at 1.53x average is above pre-filter threshold but not a dramatic surge; this reads more like steady accumulation near the high than a single institutional block print.

### KEY RISK

A reversal in Brent crude below $70 or a surprise deterioration in deepwater contract awards could rapidly reprice the entire offshore driller complex; additionally, the wide base (base_tight 3.52) and absence of an RS line at a new high mean this is not yet a textbook institutional coil - a failed breakout above $52.87 on declining volume would be a significant technical negative.

### ANALYSIS

SDRL checks the most critical box - price at a 52-week high (prox_52w 99.7) with strong 12-week RS (+15.5 vs SPY) in the leading sector - but the RS line is not yet at a new high, the base is wide at 3.52 (well above the VCP threshold), and volume is only modestly elevated at 1.53x, falling short of the institutional conviction signal needed for an A. Mixed macro regime and IWM underperformance cap the grade; a confirmed close above $52.87 on >2x volume would upgrade conviction materially.

**Signal: Close above $52.87 (52W high) on volume >1.8x 20d avera**

**Vol vs Avg: 1.53x**

## ANALYSIS

### CATALYST / TODAY'S DRIVER

Valaris is pressing against its 52-week high of $105.52 - effectively at all-time-range highs - on sector strength in Energy (+7.9% leading this week) and continued tightness in offshore rig availability globally. The move is a technical continuation within a broader deepwater capex recovery narrative, with no single-day headline required when price is this close to breaking to new highs.

### BUSINESS & POSITION

Valaris is the world's largest offshore drilling contractor by fleet size, operating drillships, semi-submersibles, and jack-ups across every major offshore basin including the Gulf of Mexico, North Sea, West Africa, and Southeast Asia. Post-2021 restructuring, the company eliminated legacy debt and now operates with a streamlined cost structure, positioning it to capture maximum operating leverage as deepwater day-rates normalize toward replacement-cost economics.

### FACTOR & THEME

Valaris is a pure-play beneficiary of the deepwater rig scarcity cycle - high-specification drillship supply is structurally constrained as no new-build orders have been placed at scale, while demand from NOCs and IOCs for ultra-deepwater exploration and development programs continues to grow. Energy is the second-leading sector this week and a multi-week leader, providing a favorable macro backdrop for the thesis.

### BREAKOUT SIGNAL

Close above $105.52 (52W high) on volume >2.0x 20d average - the price gate is essentially open; volume confirmation is the missing piece

### INSTITUTIONAL

No insider buying in the last 60 days (insider_count: 0). Institutional ownership data is unavailable from this feed - recommend 13F cross-reference; at $7.3B market cap, institutional penetration is almost certainly substantial. The 1.57x volume ratio is respectable but not a block-buying surge; the setup reads as steady accumulation near the high with the float (56.2M shares) small enough that institutional repositioning could catalyze a sharp move if the $105.52 high breaks cleanly.

### KEY RISK

The base is wide (3.49) and the RS line has not confirmed a new high, meaning the breakout lacks the tightest institutional fingerprint; a commodity-driven reversal in crude oil sentiment or a broader risk-off turn (VIX is already slightly elevated at 18.43) could send this back into the mid-$90s before it re-establishes.

### ANALYSIS

VAL is essentially at its 52-week high (99.9 prox) in the leading sector of the week, with solid RS vs SPY (+10.0), a tight float of 56.2M, and above both the 20MA and 50MA - a legitimate momentum setup. However, the RS line has not achieved a new high, the base is wide at 3.49, and volume is only 1.57x; the absence of insider activity and the mixed macro regime (IWM lagging SPY by 4% on a 20d basis) prevent an A-grade, but a volume-confirmed close above $105.52 would rapidly change the calculus.

**Signal: Close above $105.52 (52W high) on volume >2.0x 20d aver**

**Vol vs Avg: 1.57x**
