ANALYSIS

CATALYST / TODAY'S DRIVER

Post-earnings consolidation near 52W high following July 29 print; forward catalyst path includes FDA regulatory progress on T-cell therapy diagnostics and potential clinical trial data readouts in Q4 2026, plus October/November earnings (typically early November based on historical cadence).

BUSINESS & POSITION

Adaptive develops immune-driven medicine using proprietary immunosequencing platform that maps T-cell and B-cell receptors to decode the adaptive immune system for diagnostics, drug discovery, and personalized medicine. Company has partnerships with Genentech and others, positioning as a platform play in the emerging field of immune medicine with applications across oncology, autoimmune disease, and infectious disease.

FACTOR & THEME

Taps secular biotech innovation theme with focus on precision medicine and immune system decoding-adjacent to personalized cancer therapy momentum. Healthcare sector is leading (+3.8% vs SPY this week, +6.1% over 20d), providing sector tailwind, though company is pre-profitability growth stage subject to biotech volatility.

BREAKOUT SIGNAL

Close above \$25.77 on vol >1.9x of 20d avg

INSTITUTIONAL

Volume at 1.9x average suggests modest institutional participation but not the 2.5x+ breakout-level surge that confirms heavy accumulation. No insider buying in last 60 days (insider_count = 0) removes a key conviction signal. With a \$4.1B market cap and 123.8M float, this is institutionally discoverable size, but absence of insider conviction and subdued volume relative to true breakouts are notable.

EARNINGS

REPORTED

EARNINGS CONTEXT

Reported July 29, 2026 (13 days ago). Post-earnings consolidation pattern suggests the print was well-received but not a major re-rating event. Next earnings likely early November 2026 based on quarterly cadence. Historical beat/miss pattern and consensus data not provided, but proximity to 52W high post-earnings implies at minimum an in-line to slight beat.

KEY RISK

Thesis invalid on a daily close below \$24.50 (approximate 20MA support and base floor), or on any clinical trial setback or partnership termination announcement. Biotech binary event risk remains material given platform is still in commercialization phase.

ANALYSIS

Strongest disconfirming evidence: RS line is NOT at new high despite price near 52W high, indicating this is a lagging catch-up move rather than leading breakout; baseTight at 2.37 is above the VCP-ideal <2.0 threshold, suggesting wider volatility; and volume at only 1.9x lacks the institutional surge of A-grade setups. Healthcare sector leadership and extreme 84.2 RS vs SPY over 12 weeks provide tailwind, but the mega-cap leadership regime creates crosswinds for SMID. Post-earnings drift near highs with no clear October catalyst before next earnings makes this a follow-through candidate rather than an initiation. Conviction: Medium.

Signal: Close above \$25.77 on vol >1.9x of 20d avg

Vol vs Avg: 1.9x
