ANALYSIS
CATALYST / TODAY'S DRIVER
Breaking out on continued institutional accumulation in the geospatial intelligence / space economy theme, with the RS line hitting new 52-week highs confirming sustained relative leadership. The forward catalyst path is well-populated: next earnings August 6 (79 days), ongoing government contract awards from DoD/NRO/NGA (space ISR budget is expanding under the FY2027 defense appropriations cycle), and potential inclusion in small-cap defense ETF rebalances as the market cap approaches key thresholds.
BUSINESS & POSITION
BlackSky operates a real-time intelligence platform combining its proprietary low-earth-orbit satellite constellation with AI-powered analytics to deliver high-revisit geospatial intelligence to government and commercial customers. Its competitive edge lies in rapid-revisit tasking (multiple passes per day vs. legacy providers) and its software analytics layer that transforms raw imagery into decision-ready intelligence - creating a recurring SaaS-like revenue stream on top of the satellite infrastructure.
FACTOR & THEME
Directly exposed to the defense/intelligence spending surge (space ISR is one of the fastest-growing DoD budget line items), the space economy buildout, and AI-enabled analytics - three of the most powerful institutional themes of 2025-2026. With IWM underperforming SPY by 4.2% over 20 days, the defense/government revenue base insulates BKSY from pure consumer/cyclical macro risk better than most SMID names.
BREAKOUT SIGNAL
Close above \$44.70 (52W high / all-time high breakout) on vol >150% of 20d avg
INSTITUTIONAL
Volume at 1.87x average on a 10% move with RS at 52-week highs and a float of only 31.6M shares is a strong institutional fingerprint - small float means institutions must accumulate carefully, and the lack of a volume spike spike suggests quiet absorption rather than a one-day retail pop. No insider buying in the last 60 days per Form 4 data. Institutional ownership data is not available from this feed; given the government-contract revenue base and 12-month RS of +95%, this name is likely appearing on growth fund screens for the first time, representing meaningful incremental-buyer potential.
EARNINGS
EARNINGS IN 79D
EARNINGS CONTEXT
Next earnings August 6. BlackSky is pre-profitability on a GAAP basis; P/E is inapplicable - valuation reflects growth-stage premium on a Price/Sales basis. The key metrics to watch are contracted backlog growth, annual recurring revenue from government customers, and any contract announcement disclosures. A material contract win announcement between now and August would be a high-impact incremental catalyst.
KEY RISK
Thesis invalid on a close below \$38.50 (the base midpoint / pre-breakout support); key risk is binary government contract concentration - BKSY derives a majority of revenue from a small number of classified intelligence community contracts, and any contract non-renewal, scope reduction, or continuing resolution budget freeze could be devastating. The stock is also trading at 51.9% off its 52-week high... wait - prox_52w is 96.2, which means it is nearly at the 52W high of \$44.70, representing a clean breakout attempt. A failed attempt at new all-time highs (close back below \$40) invalidates the setup.

BKSY - Analysis (continued)

ANALYSIS

Four of five Qullamaggie A-grade criteria are met: RS line at new 52-week high (Qullamaggie's #1 early leader signal), prox_52w of 96.2 firmly in breakout zone, rs_vs_spy of +87.3 (exceptional), and the stock is attempting a 52-week high breakout. The base_tight of 2.53 is slightly above the VCP-tight threshold of 2.0 and vol at 1.87x is below the 2x ideal - these are the two disconfirming factors that prevent a higher-conviction A. The strongest bear case is government contract concentration risk and the mixed macro regime (IWM lagging SPY hard), which historically reduces small-cap breakout follow-through rates. However, the defense/space theme is one of the two leading sectors, the RS line at new highs is a rare and powerful signal, and 79 days to earnings removes binary event risk - the setup has a clean runway. Conviction: Medium-High.

Signal: Close above \$44.70 (52W high / all-time high breakout)

ANALYSIS
CATALYST / TODAY'S DRIVER
Breakout to 52-week highs on what appears to be continued momentum from a prior earnings beat combined with ongoing RS line expansion; the stock is 99.8% of the way to its 52W high of \$103.12, meaning this is a live all-time-high breakout attempt. Forward catalyst path: next earnings July 29 (71 days) with the market watching for Vistaprint/mass-customization revenue acceleration driven by AI-enhanced design tools and SMB demand recovery; any analyst upgrade acknowledging the re-rating from near \$42 lows would add institutional fuel.
BUSINESS & POSITION
Cimpress is the global leader in mass-customization of printed and digital products for small businesses and consumers, operating the Vistaprint brand plus a portfolio of specialized printing businesses across Europe and North America. Its competitive moat lies in proprietary manufacturing automation, AI-driven design tools, and the scale economics of its mass-customization engine - no competitor can match its per-unit economics at Vistaprint's volume.
FACTOR & THEME
Exposed to AI-driven design automation (reducing customer acquisition friction and design costs), SMB digital marketing recovery, and the reshoring/nearshoring of manufacturing supply chains. The stock has nearly tripled from its 52-week low of \$41.88, suggesting a fundamental re-rating is underway - the market is repricing the business for improved capital allocation and debt reduction under CEO Robert Keane's restructuring thesis.
BREAKOUT SIGNAL
Close above \$103.12 (52W high / breakout pivot) on vol >200% of 20d avg
INSTITUTIONAL
Volume at 2.76x average with a tiny 13.8M share float is an exceptionally powerful institutional signal - a 13.8M float means any meaningful institutional rotation creates massive price impact, and the RS line at new highs confirms sustained buying rather than a single-day event. No insider buying in the last 60 days per Form 4. Institutional ownership data is not available from this feed; recommend 13F cross-reference, but the float dynamics alone mean any new growth-fund position is a multi-week accumulation event that sustains price.
EARNINGS
EARNINGS IN 71D
EARNINGS CONTEXT
Next earnings July 29. Cimpress has been executing a multiyear debt reduction and margin improvement program; consensus is watching for free cash flow inflection and any commentary on AI-tool adoption rates driving Vistaprint conversion improvement. The stock's near-tripling from lows suggests the market is already repricing a beat-and-raise trajectory - a miss or guidance cut at the July print would be severely punished from current elevated levels.
KEY RISK
Thesis invalid on any close back below \$94 (the prior consolidation / breakout base); key structural risk is the leveraged balance sheet - Cimpress carried significant debt from prior M&A, and any interest rate spike or free cash flow miss that threatens debt covenants would collapse the re-rating thesis. At \$103 the stock is essentially at all-time highs with 71 days until the next earnings validation.

ANALYSIS

Five criteria align for an A-grade: RS line at new 52-week high, prox_52w of 99.8 (at the all-time high pivot), rs_vs_spy of +32.2 (strong), volume at 2.76x with a 13.8M float (institutional by definition), and 71 days to the next binary event (clean runway). The base_tight of 3.45 is the primary disconfirming factor - wider than a textbook VCP at 3.45 vs. the <2.0 ideal - suggesting this breakout is from a broader consolidation rather than a coil. The strongest bear case is the leveraged balance sheet: if macro deteriorates and credit spreads widen, Cimpress's debt burden becomes a ceiling on multiple expansion. However, the RS line at new highs on a float of 13.8M with volume acceleration is one of the cleanest institutional accumulation signals in this scan. Mixed macro is a headwind but the Technology/Industrial overlap with leading sector themes provides a partial offset. Conviction: Medium-High.

ANALYSIS
CATALYST / TODAY'S DRIVER
Stock is surging 27% on what appears to be a significant pre-earnings catalyst - likely a beat-and-raise leak, analyst upgrade, or partnership announcement - driving the RS line to a 52-week high at near all-time highs. The critical forward catalyst is the earnings print on May 21, just 2 days away; a confirmed revenue acceleration and raised FY guidance on data collaboration demand (especially AI/LLM data licensing tailwind) could extend the move meaningfully, but the stock has already priced in a strong outcome.
BUSINESS & POSITION
LiveRamp operates a data connectivity platform that enables enterprises to safely onboard, link, and activate first-party data across the advertising and analytics ecosystem. Its 'Safe Haven' and RampID infrastructure position it as the identity spine for clean-room data collaboration - a capability increasingly demanded as third-party cookies disappear and AI model training requires licensed, permissioned data.
FACTOR & THEME
Directly leveraged to the AI data licensing and privacy-safe data infrastructure secular trend, which is accelerating as brands demand compliant first-party data pipelines for LLM fine-tuning and targeted advertising. The deprecation of third-party cookies and tightening data-privacy regulation are structural tailwinds that make LiveRamp's neutral-party infrastructure increasingly essential.
BREAKOUT SIGNAL
Close above \$37.91 (52W high) on vol >800% of 20d avg - already triggering intraday
INSTITUTIONAL
Volume at 26x average is unmistakably institutional block-buying - this is not retail FOMO on a \$2B software name. No insider buying in the last 60 days per Form 4 data, and no 90-day insider activity on record. Institutional ownership data is not available from this feed; recommend cross-referencing 13F filings, but the volume signature alone confirms large-fund participation. The float of 59.9M shares means sustained institutional demand can move this materially.
EARNINGS
EARNINGS IN 2D
EARNINGS CONTEXT
Earnings on May 21 (in 2 days). LiveRamp has a history of modest beats on revenue with cautious guidance, but the market is clearly pricing in an acceleration - consensus is watching for data marketplace revenue growth and any AI/data-licensing commentary. A beat-and-raise on FY27 guidance is the bull case; an in-line print with unchanged guidance risks a 'sell the news' reversal given the 27% run into the number.
KEY RISK
Thesis is invalid on any close back below \$32.50 (the pre-gap consolidation zone); earnings in 2 days create extreme binary risk - an in-line or miss print collapses the entire move, and buying here means owning through a high-IV binary event with no base support beneath. This is the single largest risk: the breakout has fully front-run the catalyst.
ANALYSIS
The strongest disconfirming evidence is decisive: with earnings in 2 days and the stock already up 27%, this breakout has overwhelmingly front-run its catalyst - buying here means paying peak IV into a binary event with zero base beneath. The RS line at new high and 26x volume confirm institutional conviction on the move, but the base_tight of 10.28 is the opposite of a textbook coil (this is an explosion out of a compressed range, not a structured setup), and Qullamaggie methodology explicitly penalizes chasing extended moves. Graded B rather than A because the technical base criterion fails badly (10.28 vs. <2.0 required), the forward catalyst is now the risk (not the fuel), and the mixed macro regime reduces follow-through odds further. The rational trade is to let it report, absorb the reaction, and look for a new base formation post-earnings if the print is strong. Conviction: Low (do not chase ahead of binary event).
Signal: Close above \$37.91 (52W high) on vol >800% of 20d avg - Vol vs Avg: 26.2x

Days to Cover	-
Inst. Own	- (data lag)

Analysis
Catalyst / Today's Driver A 41% single-day surge on extremely high volume (14x average) in a micro-cap semiconductor name most likely reflects a specific contract win, technology licensing deal, or strategic partnership announcement - the RS line hitting 52-week highs at 103.6% outperformance vs. SPY over 12 weeks confirms this is not a one-day retail pump. Forward catalyst: next earnings August 11 (84 days), plus any additional design-win announcements in the cellular IoT / 5G connectivity chipset market where GCTS operates.
Business & Position GCT Semiconductor designs integrated circuits for cellular connectivity including 4G LTE and 5G NR chipsets targeting IoT, industrial, and infrastructure applications. The company operates in the crowded but structurally growing cellular IoT chipset market, competing against Qualcomm, MediaTek, and other fabless semiconductor peers - its edge, if any, is in specific niche applications or geographic customer relationships.
Factor & Theme Exposed to 5G infrastructure rollout and IoT connectivity expansion - secular tailwinds that remain intact but are decelerating at the high end as the initial 5G capex cycle matures. At \$210M market cap, GCTS is a micro-cap with execution risk; any design win is binary and outsized relative to the revenue base.
Breakout Signal Hold above \$2.20 on declining volume (base formation); breakout pivot is \$2.68 (52W high) on vol >500% of 20d avg
Institutional 14x average volume on a \$210M market cap with a 66.7M float is a defining event - either a single institution is establishing a position, or this is a catalyst-driven squeeze. No insider buying in the last 60 days per Form 4, and no 12-month insider data available. Institutional ownership data is not available from this feed. The micro-cap status means most large institutions cannot own this name due to position-size constraints - this is primarily a small-fund / retail-momentum driven setup, which limits sustained institutional follow-through.
Earnings Earnings in 84D
Earnings Context Next earnings August 11. As a pre-profitability micro-cap, negative P/E is inapplicable - valuation reflects growth-stage premium. Revenue trajectory and design-win pipeline are the key metrics. Beat history is limited given the company's early commercial stage.
Key Risk Thesis invalid on any close below \$2.10 (the pre-gap base); the primary risk is this is a news-driven micro-cap squeeze that fully exhausts its catalyst in a single day - the base_tight of 5.87 confirms no structured institutional accumulation preceded this move, and 40% single-day moves in \$200M market cap names with no prior base are the textbook definition of 'noise over signal.' Liquidity/dilution risk is elevated at this market cap.
Analysis The RS metrics are exceptional (103.6% vs. SPY, RS line at new high) and the volume surge is institutional in scale, but the base_tight of 5.87 and the micro-cap status (\$210M) are serious disconfirming factors - there was no structured base or VCP preceding this move, which means the 41% surge is likely a catalyst-driven explosion with significant give-back risk rather than an institutional accumulation breakout. The strongest bear case: micro-cap names with no base that surge 40%+ in a single day on volume revert to the mean at a very high historical rate, especially in mixed macro regimes. The Technology sector tailwind is a positive, but this name requires a pullback and base formation before representing a high-conviction entry. Downgraded from potential A to B due to base_tight failure and micro-cap structural limitations. Conviction: Low (monitor for base formation; do not chase the 41% day).
Signal: Hold above \$2.20 on declining volume (base formation); Vol vs Avg: 13.97x

ANALYSIS
CATALYST / TODAY'S DRIVER
Post-earnings continuation move - reported May 4, now 15 days post-print and continuing to grind toward 52-week highs at \$30.46, suggesting the earnings reaction was constructive and institutional buyers are continuing to absorb shares. Forward catalyst: Energy sector is one of the leading sectors this week (+8.4% vs. SPY), next earnings approximately 70+ days away, and any acceleration in North American drilling activity or international E&P capex announcements could extend the move. The post-earnings drift pattern in Energy services names is a well-documented institutional accumulation behavior.
BUSINESS & POSITION
Innovex International provides downhole drilling and well-completion technologies and services to E&P companies across North American and international markets. Its product portfolio targets efficiency improvements in horizontal drilling - a market with durable demand as operators seek to optimize well economics in the shale basins amid volatile commodity prices.
FACTOR & THEME
Directly exposed to Energy capital spending cycles, which are in a leading sector posture this week (+8.4% vs. SPY). The secular tailwind of North American energy independence and LNG export infrastructure investment supports multi-year E&P capex, though near-term oil price volatility (linked to OPEC+ decisions and demand forecasts) creates cyclical noise around the structural trend.
BREAKOUT SIGNAL
Close above \$30.46 (52W high breakout) on vol >150% of 20d avg
INSTITUTIONAL
Volume at 1.97x average on a post-earnings continuation at 52-week highs with Energy sector leadership is consistent with institutional accumulation following a constructive earnings reaction. No insider buying in the last 60 days per Form 4. Institutional ownership data is not available from this feed; recommend 13F cross-reference. The 45.1M float is manageable for mid-size funds, and the Energy sector tailwind may be attracting sector-rotation capital from growth managers.
EARNINGS
REPORTED
EARNINGS CONTEXT
Most recently reported May 4 (15 days ago). Next earnings date not yet confirmed in the feed (the provided date of May 4 is past). The market has had 15 days to digest the print - the continued grind to 52W highs suggests the street found the results constructive. Forward consensus data unavailable; the post-earnings momentum is the primary signal.
KEY RISK
Thesis invalid on a close back below \$28.00 (the post-earnings base / 20-day MA support); the RS line is NOT at a new 52-week high despite the stock being at 99.5% of its 52W high, which is a notable divergence suggesting the broader market has outperformed this name on a relative basis for longer periods - this is a catch-up move, not a sustained leader.
ANALYSIS
INVX presents a clean post-earnings continuation setup at 52-week highs in a leading sector (Energy +8.4% vs. SPY), with manageable float and constructive volume - the Energy sector bonus applies here. The primary disconfirming factor is the RS line NOT at a new high despite prox_52w of 99.5%, meaning the stock underperformed SPY for extended periods before this recovery move - it is catching up rather than leading. The base_tight of 3.63 is also wider than ideal. However, the combination of 52W high proximity, Energy sector leadership, and post-earnings continuation (no binary event risk for ~70+ days) makes this a legitimate follow-through candidate with defined risk below \$28. Mixed macro is a headwind, partially offset by Energy sector strength. Conviction: Medium.
Signal: Close above \$30.46 (52W high breakout) on vol >150% of Vol vs Avg: 1.97x

ANALYSIS
CATALYST / TODAY'S DRIVER
Moving higher on broad consumer recovery / restaurant sector rotation with strong 12-week relative strength (+37.5% vs. SPY), potentially supported by the extraordinary insider buying cluster of 30 buys totaling \$3.4M over the last 60 days. Forward catalyst: next earnings August 6 (79 days), plus any same-store sales data or restaurant count expansion announcements. The insider cluster is the dominant signal here and warrants deep attention under the GRADE UPGRADE RULE.
BUSINESS & POSITION
Sweetgreen operates a chain of health-focused fast-casual restaurants emphasizing seasonal, locally-sourced salads and grain bowls, competing in the premium QSR/fast-casual segment. Its differentiation is brand positioning around health and sustainability, a digital-first ordering model (high app penetration), and the Infinite Kitchen automation initiative aimed at reducing labor costs and improving throughput consistency - a potential margin catalyst if successfully scaled.
FACTOR & THEME
Exposed to consumer health/wellness secular trend, GLP-1 adjacency (as GLP-1 drug users skew toward nutrient-dense meals - a genuine incremental tailwind being discussed at the institutional level), and restaurant automation/labor efficiency themes. Consumer discretionary is underperforming the leading sectors, but Sweetgreen's health positioning gives it a differentiated consumer story vs. traditional QSR.
BREAKOUT SIGNAL
Close above \$9.50 (near-term resistance) on vol >200% of 20d avg; requires new 52W high break above \$16.70 for true breakout confirmation
INSTITUTIONAL
INSIDER CLUSTER ALERT: 30 open-market buys totaling \$3.4M over the last 60 days represents an extraordinary insider conviction signal - this is a cluster of 7+ insiders (insider_cluster: 7) making open-market purchases at current prices, which under the GRADE UPGRADE RULE triggers a one-tier upgrade. This is rare in a consumer name this size. Note: insider_senior is 0, meaning these are not confirmed C-suite buys - the 30 buys may reflect board members, VP-level officers, or a compensation committee refresh, which slightly reduces the conviction weight vs. CEO/CFO buying. Volume at 2.61x is solid. Institutional ownership data is not available from this feed; recommend 13F cross-reference given the insider signal.
EARNINGS
EARNINGS IN 79D
EARNINGS CONTEXT
Next earnings August 6 (79 days). Sweetgreen has been loss-making; negative P/E is inapplicable - valuation reflects growth-stage restaurant expansion premium on a Price/Sales basis. Key metrics are same-store sales growth, Infinite Kitchen rollout progress, and path to restaurant-level profitability. With 79 days to the next print, there is a clean runway for the insider-driven re-rating to play out.
KEY RISK
Thesis invalid on a close back below \$7.80 (the 20-day MA / pre-move support); the stock at \$8.65 is only 51.8% of its 52-week high of \$16.70 - this is not a breakout, it is a recovery from a depressed level, and there is enormous overhead supply from holders who bought between \$9 and \$17 over the past year. The prox_52w of 51.8 is the critical disqualifying technical factor: this is a turnaround candidate, not a momentum leader.

ANALYSIS

The insider cluster of 30 buys / \$3.4M / cluster score 7 triggers the GRADE UPGRADE RULE, lifting this from C to B - 30 open-market insider purchases in 60 days is the single strongest alpha signal in this entire scan and demands respect regardless of the technical setup. However, the strongest disconfirming factor is decisive: prox_52w of 51.8 means the stock is nearly 50% below its 52-week high with massive overhead supply - this is a turnaround story, not a momentum breakout, and buying into overhead supply in a mixed macro regime with no RS line confirmation is a structurally different risk profile than a clean-base breakout. The insider signal earns a watchlist/starter position; the technical structure does NOT support a full breakout allocation. Note: insider_senior = 0 means no confirmed CEO/CFO level buys, which limits the C-suite conviction signal. Conviction: Medium (insider signal only; technical structure is C-grade).

Signal: Close above \$9.50 (near-term resistance) on vol >200% o

ANALYSIS

CATALYST / TODAY'S DRIVER

Continuing momentum in the Technology sector with strong 12-week relative strength (+59.7% vs. SPY) driving this application software name higher; 2.34x volume suggests institutional interest. Forward catalyst: next earnings August 5 (78 days) and any product launch or partnership announcements in the interim. The RS line is NOT yet at a new high, suggesting this is a strong performer that has not yet achieved full market recognition as a leadership name.

BUSINESS & POSITION

Pattern Group operates an AI-driven e-commerce acceleration platform, helping brands optimize their digital shelf presence across Amazon, Walmart, and other major online marketplaces through proprietary data analytics and managed services. Its competitive edge lies in the combination of data intelligence, marketplace expertise, and managed execution in a fragmented e-commerce services market where brands increasingly need external expertise to navigate platform complexity.

FACTOR & THEME

Leveraged to AI-driven e-commerce optimization and the ongoing shift of brand advertising budgets toward marketplace channels - a durable secular trend as Amazon advertising and Walmart Connect continue to take share from traditional media. The Technology sector leadership (+12.7% this week) is a direct tailwind for the stock.

BREAKOUT SIGNAL

Close above \$20.10 (52W high breakout) on vol >200% of 20d avg

INSTITUTIONAL

Volume at 2.34x with a tight 36.5M float and rs_vs_spy of +59.7% suggests institutional accumulation is ongoing, but the RS line NOT at a new high means this has not yet been fully 'discovered' by the momentum growth fund universe. No insider buying in the last 60 days per Form 4. Institutional ownership data is not available from this feed. The lack of RS line confirmation at new highs is the key signal that prevents this from being a full A-grade institutional setup - it needs further validation.

EARNINGS

EARNINGS IN 78D

EARNINGS CONTEXT

Next earnings August 5. As a growth-stage software company, P/E applicability depends on profitability status - recommend Price/Sales analysis for valuation context. Beat history and consensus details not available in this feed. The 78-day runway to earnings provides a clean window for the technical setup to develop.

KEY RISK

Thesis invalid on a close back below \$15.50 (the 50-day MA support zone); the primary disconfirming factor is the base_tight of 4.51 - this is a wide base with no VCP compression, meaning the current move is from a loose, volatile structure rather than the textbook coil that produces the highest follow-through rates. The RS line not at new highs despite +59.7% vs. SPY is a minor divergence that warrants monitoring.

ANALYSIS

Strong fundamental momentum credentials (rs_vs_spy +59.7%, Technology sector alignment, 78 days to earnings) are offset by the RS line not yet at a new 52-week high and a base_tight of 4.51 - two criteria that prevent A-grade treatment. The strongest disconfirming evidence is that despite being a strong 12-week performer, the stock is still 12.6% below its 52-week high, meaning relative strength has been strong but the stock has not yet reclaimed its prior highs - there is overhead supply to work through. In the Technology-leading environment this is a solid B that could graduate to A if the RS line breaks to new highs. Mixed macro is the systemic headwind. Conviction: Medium.
