| A +10.6% single-day surge driven by a likely earnings beat or significant contract/volume guidance upgrade in the freight brokerage space, where cyclical recovery signals are accelerating; forward catalyst path includes the Aug 6 earnings print in 79 days, which is the next hard test of whether freight volumes and yield-per-load are sustaining - a serial beat cycle here is the durable extension thesis.                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| BUSINESS & POSITION                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| RXO is a tech-enabled freight brokerage and managed transportation platform spun off from XPO in 2022, connecting shippers with carriers via a digital marketplace. It operates in a fragmented \$100B+ US truck brokerage market and competes on technology-driven load matching, positioning itself as a mid-market disruptor with scalable fixed-cost leverage as volumes recover.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| FACTOR & THEME                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Primary exposure is to the US freight cycle recovery, a high-beta industrial/macro theme - as manufacturing reshoring and inventory restocking accelerate, brokerage volumes and take rates expand disproportionately. Secondary exposure to supply-chain digitization and logistics-tech as a secular tailwind, a theme whose momentum is rebuilding after a 2023-2024 freight recession trough.                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| BREAKOUT SIGNAL                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Close above \$21.13 on vol >190% of 20d avg; watch for consolidation hold above \$20.00 as the new base floor                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| Vol ratio of 2.1x on a +10.6% move strongly suggests institutional block accumulation rather than retail FOMO - the magnitude and volume together indicate real money repositioning into a freight recovery thesis. No insider buying in the last 60 days (insider_count: 0); no 90-day insider data available to supplement. Float of 125.4M is the largest in this scan, which reduces short-squeeze mechanics but does not dilute institutional re-rating potential on fundamental recovery.                                                                                                                                                                                                                                                                                                                                                                      |

| Next earnings August 6 (79 days). RXO is an early-stage public company post-spin; consensus will be focused on load volume growth, take-rate trajectory, and EBITDA margin expansion. Beat history is limited given spin recency - any positive guidance revision on freight market tightening would be a meaningful re-rating catalyst. Current move may already be discounting a guidance raise, so the Aug print becomes the key confirmation event.                                                                                                                                                                                                                                                                                                                                                                                                              |
| KEY RISK                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Thesis is invalid on a close back below \$19.00 (the pre-breakout base top and approximate 20MA support); a freight volume deceleration or yield compression in June-July data prints ahead of Aug 6 earnings would also negate the recovery narrative and make this a one-day event pop with no follow-through.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| ANALYSIS                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| The strongest disconfirming evidence is the wide base (base_tight 4.43 - far outside VCP territory) and the RS line NOT at a new 52-week high, meaning RXO has not yet confirmed sustained leadership status despite today's explosive move; it is also 9.6% below the 52-week high, so this is a mid-base breakout attempt rather than a clean 52-week breakout. The bull case is compelling - rs_vs_spy of +27.2 over 12 weeks, a +10.6% day on 2.1x volume, and a freight recovery cycle that is early-innings - but the mixed macro regime (IWM underperforming SPY by 4.3%) creates a headwind for industrial/freight names and reduces follow-through probability. No insider buying to upgrade conviction. This is a high-quality B with a live forward catalyst 79 days out, but requires a tighter re-base before committing full size. Conviction: Medium. |
| Signal: Close above \$21.13 on vol >190% of 20d avg; watch for c                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Vol vs Avg: 2.1x                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

ANALYSIS

CATALYST / TODAY'S DRIVER

A +9.2% breakout move driven by a likely earnings beat or significant ARR/NRR acceleration in vulnerability management and exposure management software, possibly accompanied by raised full-year guidance; the critical forward catalyst is the July 29 earnings print in 71 days, where confirmation of enterprise deal velocity, cloud/OT security expansion, and margin improvement would be the re-rating event - a sector tailwind from the Technology sector leading +9.6% vs SPY this week provides additional lift.

BUSINESS & POSITION

Tenable is the global leader in cyber exposure and vulnerability management, offering the Nessus and Tenable.io platforms used by 44,000+ organizations to identify, assess, and prioritize security exposures across IT, OT, and cloud environments. It holds a dominant market position in vulnerability scanning with a rapidly growing cloud-delivered SaaS business, competing against Qualys and CrowdStrike's exposure capabilities.

FACTOR & THEME

Direct exposure to the cybersecurity secular growth theme, which is accelerating as enterprise attack surfaces expand across cloud, OT/ICS, and AI-driven infrastructure - regulatory pressure (SEC cyber disclosure rules, NIS2 in Europe) is creating non-discretionary budget demand. Secondary AI infrastructure angle as Tenable integrates AI-assisted exposure prioritization into its platform, a differentiation lever that is gaining commercial traction.

BREAKOUT SIGNAL

Close above \$25.25 on vol >175% of 20d avg; secondary confirmation on a close above \$28.00 which would materially close the gap to 52-week highs

INSTITUTIONAL

GRADE UPGRADE APPLIED: insider\_cluster score of 7 with 1 C-suite open-market buy of \$258K in the last 60 days triggers the upgrade rule (B upgraded consideration); however, with only 1 individual buyer (not a cluster of 5+), the upgrade is noted but not mechanically applied to full A-grade without additional technical confirmation - the prox\_52w of 70.7 and wide base (3.9) prevent an A grade on fundamentals alone. The C-suite open-market buy of \$258K is a meaningful positive signal - insiders buying at these levels signals management conviction that the stock is undervalued relative to business trajectory. The +9.2% day on 1.83x vol in the leading Technology sector this week suggests institutional re-rating rather than retail momentum.

EARNINGS

EARNINGS IN 71D

EARNINGS CONTEXT

Next earnings July 29 (71 days). Consensus will focus on ARR growth (target ~\$1B+), net retention rate trends, and operating leverage as the company transitions to profitability. Tenable has a history of conservative guidance with beat-and-raise cadence in recent quarters; if enterprise security budgets are holding firm in a cost-scrutiny environment, this becomes a serial-beater re-rating story. At prox\_52w of 70.7, the stock is still 29% below its 52-week high, suggesting the market has not yet priced in a full recovery - making the July print a high-stakes catalyst.

KEY RISK

Thesis is invalid on a close back below \$23.00 (the pre-breakout consolidation zone and approximate 50MA support); the single strongest disconfirming factor is that at prox\_52w of 70.7, this stock remains deeply below its 52-week high, meaning today's move is a mid-range bounce rather than a true breakout - enterprise software budget scrutiny in a mixed macro environment could cap the move before the RS line reaches new highs.

ANALYSIS

The strongest disconfirming evidence is the prox\_52w of only 70.7 - this stock is nearly 30% below its 52-week high, meaning today's +9.2% move is a recovery bounce within a larger downtrend, not a true breakout from a high base; the RS line is not at a new high and base\_tight of 3.9 is wide, so the Qullamaggie setup criteria are only partially met. The bull case is anchored by a real C-suite open-market buy (\$258K, last 60 days) which is a rare and high-conviction insider signal, a leading sector tailwind (Technology +9.6% vs SPY), and a live forward catalyst in 71 days. The mixed macro regime (IWM lagging SPY by 4.3%) is a headwind. This is a B with notable insider conviction, but the technical structure needs to rebuild before a higher-conviction entry materializes - better risk/reward on a tighter base closer to 52-week highs. Conviction: Medium.

ANALYSIS

CATALYST / TODAY'S DRIVER

Modest +0.76% move near 52-week highs (prox\_52w 98.8) on elevated volume (1.83x), likely driven by Energy sector leadership this week (+8.4% vs SPY) and sympathy buying in oilfield services; forward catalyst is the Aug 5 earnings print in 78 days where wellhead equipment demand and pricing power data will be key.

BUSINESS & POSITION

Cactus designs and manufactures wellheads and pressure control equipment for onshore oil and gas drilling in the US, with a dominant position in the Permian Basin and other major shale plays. It benefits from pricing power in a specialized, safety-critical product category with high switching costs and an asset-light manufacturing model that drives above-peer margins.

FACTOR & THEME

Direct exposure to US energy capex spending, a theme that is accelerating with Energy leading +8.4% vs SPY this week; secondary exposure to Permian Basin activity levels, which remain structurally elevated even in a modestly lower oil price environment due to breakeven economics. Reshoring and energy security themes provide a policy tailwind.

BREAKOUT SIGNAL

Close above \$61.51 (52-week high breakout) on vol >180% of 20d avg

INSTITUTIONAL

No insider buying in the last 60 days (insider\_count: 0, insider\_cluster: 0); no insider activity to support an upgrade. Institutional ownership data not available from this feed - recommend cross-referencing 13F filings. The 1.83x volume on a near-52-week-high stock in a leading sector is consistent with quiet institutional accumulation, but the lack of insider activity and negative RS vs SPY (-3.7) reduces conviction.

EARNINGS

EARNINGS IN 78D

EARNINGS CONTEXT

Next earnings August 5 (78 days). Consensus will focus on wellhead shipment volumes, backlog, and pricing; Cactus has historically been a consistent beat-and-raise name given its Permian-heavy exposure. No imminent catalyst before the Aug print, making this a technical/sector-rotation setup rather than a fundamental inflection story near-term.

KEY RISK

Thesis is invalid on a close back below \$57.50 (the base support and approximate 20MA level); a drop in WTI crude below \$65/bbl or a deceleration in Permian rig counts in the next monthly Baker Hughes data release would directly threaten wellhead demand assumptions and invalidate the energy recovery thesis.

ANALYSIS

The strongest disconfirming evidence is the negative rs\_vs\_spy of -3.7 - Cactus is underperforming the market over 12 weeks despite being near its 52-week high, which means the RS line is NOT confirming leadership, a critical Qullamaggie disqualifier; the wide base (3.97) and lack of any insider buying further reduce conviction. The bull case is proximity to 52-week highs (98.8), a small tight float (58.9M), and Energy sector leadership this week - but a stock that is near 52-week highs while underperforming SPY is a divergence that signals sector rotation benefit rather than true fundamental outperformance. The mixed macro regime and IWM weakness are additional headwinds for a mid-cap industrial/energy name. This is a watchlist B pending a clean 52-week high breakout with improved RS. Conviction: Low.

Signal: Close above \$61.51 (52-week high breakout) on vol >180%
